

TOTE Quick Guide

Generate a clear equipment summary and printable pick list from a technician's current inventory.

TOTE compares a technician's current equipment against established category maximums. It automatically groups applicable equipment models, totals each category, and calculates how many additional units can be issued without exceeding the established stocking level.

1. **Export or download the technician's current inventory file.**
2. **Load the inventory file into TOTE.** Drag the file into the upload area, or click/tap the area to browse for the file.
3. **Select Generate Summary.** TOTE reads the inventory and automatically calculates the category totals.
4. **Review Current Inventory and the Category Summary.** The summary shows **Max / Current / Over / Add** for each equipment category.
5. **Confirm the quantities that need to be picked.** The **Add** column shows how many additional units can be issued for each category.
6. **Enter the technician's name.** The name is **not required to generate the summary**, but it is **required before the summary can be printed**.
7. **Select Print Summary.** Use the printed **Items to Pick** section while gathering the equipment.

How the numbers work

TOTE does more than subtract one item count from a maximum. It automatically combines the individual equipment models that belong to the same stocking category, totals those quantities, and compares the category total with its established maximum. The result is displayed in the **Max / Current / Over / Add** summary.

Example: Instead of manually counting the 411s, 611s and 632s, adding those quantities together, and then subtracting the total from the category maximum, TOTE performs that calculation automatically.

Quick reminder: If Print Summary is unavailable, confirm that a technician name has been entered.
