

TAU – Frequently Asked Questions

How do we know the data is accurate?

It's based on direct barcode scans, which removes manual entry errors. Anything not scanned is automatically flagged as missing.

What if a tech scans something twice?

Duplicate scans are ignored, so they do not affect the results.

What if they don't scan everything?

Anything not scanned is flagged as missing—that's the purpose of the audit.

Do they need training?

Minimal training is required. The process is scan-based and the steps are clearly outlined on the flyer. Most users can pick it up in a few minutes.

Can this go to a different email or system?

Yes. The current setup routes through a demo email, but it can be configured to send to any mailbox or automated workflow using Power Automate.

How long does this take?

Approximately 15 minutes for around 30 items, with no follow-up emails or manual tracking required.

Can we track trends or history?

Yes. Since the data lands in SharePoint, it can be used for reporting, tracking trends, and historical analysis.

What if someone uses the wrong file?

The audit will reflect the file used, but this is controlled at the source when inventory files are distributed.

Can this scale to other areas?

Yes. The system is not tied to a single location and can be used across multiple yards or expanded to other regions.
